

**The Changes (1961-2014) in the pyramid of the Greek population (in Greek),
*Demographic News, no 24, 2015, 4 p.***

ABSTRACT

Population in Greece has increased by 2.5 million over the last fifty years and while its average age has also increased by almost 11 years. Examining the shape of population pyramids, one can easily follow the evolution of population structure by sex and age. In this article the transition of population in Greece from a relatively young population in the aftermath of the Greek civil war in a rather aging population at the beginning of the current decade is examined, considering the population pyramids in four different moments, in equidistant time intervals of two decades between them, i.e. 1961, 1981, 2001, and 2014.
